# 2Way Release Notes - 6.10.2020

Backend v1.93 (Backend only release)

Indicates changes from previous release notes.

Improvements and updates - *Backend*

▸ **Backend code updated to PHP v7.3** - Very big under the hood update. No difference in user interface but should notice considerable **performance improvement** for apps and backend since everything is more optimized at the source.

▸ **Users password restriction removed**. No longer required to add a password when adding members manually in backend. Implemented in late 2018, members will receive a OTP (one time password) in email when logging in for first time if no password present.

▸ **Group Code column in applicable modules**. Limit set to width of this column to improve UI when numerous recipient groups where being selected. All groups are still being revealed, just hover your pointer over the field.

Fixes

▸ Fixed. Random issues when adding pdf's in documents
▸ Fixed. Login password in some cases not received

Supported operating systems

▸ iOs 10 and up
▸ Android 5.0 (Lollipop) and up
